Configurations of Interest

Most people tell me they find the following configurations useful: - .zshrc setup - Starship Prompt - Pandoc configs & pointers on how to use pandoc - complex modifications for Karabiner Elements - .obsidian.vimrc via the vimrc Support Plugin - neovim config

What is this repository?

Essentially, it's all of my dotfiles, that I put online for backup, version history, and easy sharing with others.

What are "dotfiles"? - Read this excellent primer what dotfiles are. - Here is an interesting report on common contents of dotfiles.

How this repository works - These files are symlinked into iCloud for synchronization. - `Hammerspoon` is configured to run the script git-dotfile-sync.sh every 15 minutes, or on wake/sleep. In addition, the Alfred keyword `shutdown` will trigger the script before shutting down. - The git repos that are nested inside this dotfile repository (i.e. Alfred git repositories, because the nesting can't be avoided in this case) are gitignored and pulled individually. - git-dotfile-backup.sh checks whether there have been any changes in dot files. If there are, it creates somewhat useful commit messages and runs the `git add commit pull push` sequence. - .gitignore contains a list of files not to backups for various reasons, e.g., redundancy, privacy, or simply because they are too big for a git repo.

Got an idea for an improvement?

Feel free to open an issue to suggest an improvement to my settings. :blush:

About Me

In my day job, I am a sociologist studying the social mechanisms underlying the digital economy. For my PhD project, I investigate the governance of the app economy and how software ecosystems manage the tension between innovation and compatibility. If you are interested in this subject, feel free to get in touch.
